

# Radius, Explanation of:

From the point where a character is standing, out to the area of effect, and all the way around, is considered the Radius. This is usually given in the measurement of “spaces” (each space = 5'). A torch has a illumination radius of 6 spaces (30') out, and all the way around, the holder of the torch. Thus the radius illumination of a torch is 30'. All the area about the holder of the torch, up to 6 spaces (30') out, is effected by the illumination effect.
